

FunCube

The FUNcube sub-system provides UKube with the capability for educational outreach to students at schools and colleges and also a "redundant" communications system.

A simple "ground station" receiver is also already in manufacture. This has been developed to allow direct reception of the FUNcube signals from space. The receiver is actually a USB dongle and will be made available economically for educational purposes.

Display software and support material is also being developed so that the whole experience will be stimulating for the children and encourage their interest in all STEM subjects. The development is being undertaken and financed entirely by volunteer members and friends of AMSAT-UK
